

5                                   An Executable Application Access Management System

                                  Abstract Of The Disclosure

          A system enables individual organizations of multiple different organizations to  
manage access of employees to a remotely located application hosted by an application  
10   service provider. The system includes a database and a command processor. The database  
contains data representing multiple user interface images and multiple executable procedures.  
The multiple user interface images are associated with corresponding multiple organizations.  
The multiple executable procedures are associated with corresponding multiple user interface  
images. An executable procedure supports a user of a particular organization in managing  
15   access of employees of the particular organization to an application hosted by an application  
service provider. The command processor employs the database for initiating execution of a  
particular executable procedure in response to a command initiated using a particular user  
interface image associated with the particular executable procedure and with the particular  
organization. The particular executable procedure supports the user in managing access of an  
20   employee of the particular organization to an application.
